Basic Thesis

• The policy solution to excessive emissions of GHGs is well established:
  – In theory
  – In (very large scale) experiments

• The policy community (a.k.a. climate scientists) should stop suggesting that we do not know what to do about climate change. In 2014 we spent $11.7bn p.a. on RES RD+D and in power global RES investment is closing in on global fossil investment (UNEP/BNEF, 2015).

• We should (simply!) implement a reasonably comprehensive set of quantity restrictions on CO2e, building on EUETS experience.
Outline

• A global carbon market?

• The EU ETS: Progress and Prospects

• The Australian Carbon Tax Lessons

• US Regional carbon market initiatives and recent EPA announcements

• Chinese carbon markets
Basic facts of carbon markets

- Carbon markets have most value in the early stages of decarbonisation. They help with:
  - the mix of sectors to decarbonise
  - the mix of existing low carbon technologies per sector
  - the mixing demand side reduction and substitution
  - guiding consumer and climate NGO pressure.

- They are about identification of low cost decarbonisation within a general equilibrium (i.e. multiple interconnected markets) setting.
Basic facts of carbon markets

• Many don’t like carbon markets precisely because they deal so effectively with the general equilibrium issues.

• They are transparent and highlight:
  – Differences between included and non-included parties
  – Incidence of final costs and prices, especially to consumers
  – Financial flows within and between countries
  – The cost impact of political interventions
  – Lowest cost interventions and restrain special interests

• Basically, political opposition to the use of carbon markets is based on the fact that they do work in a predictable way.
A global carbon market?

• What are the characteristics of a global market?
• All that needs to be true is that markets are interconnected enough for major price differences between significant regions to be arbitraged.
• This does not require a single trading platform or integrated regional platforms (as for oil, or foreign currency).
• It can involve a combination of markets and administered prices (i.e. taxes).
• Over time price convergence is likely, though not certain, if costs of non-alignment are large.
A Global Carbon Market?

Basic parameters:

- Global carbon market:
- 49,000 m tonnes CO2e in 2014
- *$100 per tonne CO2e (true cost of carbon?*)
- =$4900 bn per year
- *In reality perhaps 10,000 m tonnes at $80 per tonne, with 10% traded = $80 bn p.a. traded (memo: Aid budget: $135bn)*

- For comparison: Global oil market:
- 85 million barrels per day
- * 365 days * $100 per barrel
- = $3102 bn per year
Basic Numbers for carbon markets

- There are c.190 states in the world
- G20 + Spain = 85% of world GDP
- G20 + Spain = 77% of world CO2e (exc LUCF)
- Plus next 10 country emitters = 85% of world CO2e

- The EUETS has 31 countries participating.
- Of the G21, 6 (inc. EU) are in the EUETS.
- Of the OECD-34, 21 are in the EUETS.
- Of the rest many are in the spheres of influence of the largest 31 emitting countries.
- This is not primarily a problem of negotiation.
Why coordinating on price is better than on quantities

• If the slope of the MC curve is steeper than the slope of the MB curve, then better to set tax than set quantity if there is uncertainty in MC curve (Weitzman, 1974).

• But…

• There is a lot of uncertainty in the marginal benefit curve (i.e. we don’t know where the climate damage effects exactly kick in or how world society would adjust if they did).

• If the marginal cost of abatement is actually well defined / lower than we predict then unlikely that mistake in quantity worse than in price.

• The Weitzman thesis ignores the fact that quantities would be tightened over time, leading to incorporation of learning on position of curves.
Why coordinating on quantities is better than on prices

• Some different theory:

• *Climate Science* can and does frame the problem as being about the specific quantity of GHGs emitted (e.g. Max = c.1000 GTC) (e.g. Allen et al., 2009). Quantity limitation coordinates the economic framing and the scientific framing.

• *Legal precedents* especially on ownership and sovereignty must be respected. Tradable quantities with initial allocations of pollution rights are consistent with the current basis of property rights and trade in a way that a coordinated tax rate is not.
Why coordinating on quantities is easier than prices

A lot of evidence:

- The EU could not agree on a carbon tax but could on a trading system.
- No example globally of any exact coordination on taxes.
- Taxes difficult to adjust and coordinate within countries.
- Energy taxation on different fuels shows wide variance within and between countries…
- Specifically vested interests find it easy to keep taxes at a low level or gain lots of exemptions, due to lack of transparency…
- Carbon taxation has had only limited application and proved domestically controversial…
## Carbon markets – coverage 2013

- **EUETS** 2084 mt p.a. (2013)
- **China** 1115 mt p.a. (2013-14)
- **Australia (tax)** 283 mt p.a. (2012-13)
- **California-Quebec** 184 mt p.a. (2013)
- **Kazakhstan** 147 mt p.a. (2013)
- **New Zealand** 31 mt p.a. (2011)
- **Switzerland** 3 mt p.a. (2013)
- **UNFCC – CDMs** 350 mt p.a. (2013)
- **Total:** c.9% of global emissions
World Carbon Prices

Carbon markets – prices (as of 01/07/15)

• EUETS 7.46 Euros / tCO2
• California-Quebec 12.29 USD / tCO2e
• RGGI 5.50 USD / tCO2

• Total coverage of all carbon pricing 12% CO2e
• Total value of all carbon pricing c.$30bn p.a.

• Memo:
  – Renewable Subsidies globally, $121bn in 2013.
EU ETS – price history

Evolution of EU ETS rules

- Now an EU wide cap with allocations of auction shares.
- Free allocations, now only residual to trade impacted sectors.
- Increasingly using linkage rather than offsets.
- However substantial overhang of allowances, banked for future use.
EU 2030 Targets

• from EU Commission:
  
  – 40% reduction in GHG emissions (relative to 1990)
    = 25% reduction from 2020 target in 10 years
    ⇒ 43% reduction of ETS sector relative to 2005
  
  – EU-wide RE target of 27%
    • Unclear enforcement; Delivered by GHG reduction
      (with Energy price + premium and auctioning)
  
  – Energy Efficiency target of 27% relative to business as usual (up from 20% in 2020)
A setback in the outback: Australian carbon tax

- Introduced in July 2012 at AUD 24.15 (c.16 Euros) per tonne CO2e, with view to move to cap and trade in July 2015. Coverage: 60%.
- Conservative led government wins with mandate to abolish carbon tax.
- Robson (2014) gives an interesting analysis of the failure of the Australian carbon tax, suggesting that other measures (such as subsidies to renewables) might have been more effective.
- Taxes clearly not superior to cap and trade: no policy certainty and the basic economics was not effected by price volatility.
- Starting at low carbon prices has political advantages. The initial price was high for an energy intensive open economy.
- Although the fiscal transfers were poorly targeted.
US progress? Under Clean Air Act (Palmer, 14)

- 2007 Mass v. EPA – Supreme Court affirms EPA authority to regulate under Clean Air Act
- 2009 Endangerment and Cause or Contribute Findings
- 2010 Settlement Agreement Between State Petitioners, Environmental Petitioners, and EPA
- 2011 (I) Mobile source standards -- 5%/yr improvement to 35.5mpg fleet avg. in 2016; 54.5 mpg by 2025
- 2011 (II) Construction permitting -- implementation by the states
- 2014 (III) Stationary sources -- performance standards for new and existing (proposed) electricity generators (32% of emissions). Proposes State level Goals (Adjusted MWh-Weighted-Average Pounds of CO2 per Net MWh) covering all Affected Fossil Fuel-Fired units
- In the meantime local, state and regional initiatives
US EPA Implementation...

- Policy is implemented by the States
- State plans due to EPA by 2016 (1 yr. extension allowed)
- Compliance period begins in 2020
- Multiple pathways for State
  - Rate-based or mass-based standard
  - Trading is possible but up to states
  - Must show equivalence to BSER
- Multi-state budget programs allowed
  - Two-year deadline extension for multi-state plan
US EPA Analysis...

- EPA’s internal analysis finds the following:
  - Power sector CO2 emissions fall 25-30% below 2005 levels in 2025 – a reduction of 18-25% relative to business-as-usual baseline.
  - Social costs of tCO2: $13, $46, $68, and $137 (2011$), under different discount rate assumptions.
  - Monetized benefits (3% discount) of B$35 - 58 in 2020 & B$58 - 93 in 2030 (2011$)
  - Significant health benefits (more than half) attributed to other local and regional pollutants...
  - Total Compliance costs are $6-9 billion; average costs of $11-20 per tonne CO2.
Chinese progress on carbon trading...

- China is now the World’s biggest emitter of GHGs.
- NDRC (National Development and Reform Commission) indicates that China’s climate change-related goals for 2020 include the following:
  - Reduce CO2 per unit of GDP by 40-45% relative to 2005.
  - Increase the ratio of non-fossil energy to the consumption of primary energy to 15%.
- In addition, goals to be achieved by FYP (five year plan) 12’s completion, or the end of 2015, include:
  - Relative to the end of the end of FYP 11, reduce CO2 per unit of GDP by 17%.
  - Reduce national energy consumption per unit of GDP by 16% relative to the end of FYP 11.
- The intention is to move from local pilots to a national carbon market by 2016.

Conclusions

• The idea of using the market to deliver carbon reductions is an potent one relative to the alternatives (of subsidies to low carbon technologies).

• It has had significant apparent setbacks in the EU ETS and in Australia.

• However the apparently intractable problems of getting US and China to participate in global emissions reduction are being addressed by locally delivered solutions which emphasise non-climate benefits.

• The policy instrument to solve the climate problem is not rocket science; economists worked out the policy answer to excessive emissions years ago. It is time for nation states to actually agree it is a problem and participate in a global market…
